

Comprehensive relay protection current setting value

Overview

Use this Protection Relay Setting Calculator to calculate pickup current, time multiplier settings (TMS), operating time, coordination time interval (CTI), and plug setting multiplier (PSM) using fault current, CT ratio, and IEC 60255 curve parameters. This adjustment is called the current setting of the relay. These calculations are critical in industrial. Selective short-circuit protection can be achieved in different ways, such as: Time-graded protection Time- and current-graded protection A straightforward way of obtaining selective protection is to use time grading. Essential tool for relay technicians, protection engineers, and commissioning specialists. Protection selectivity is partly. Protection relays employ a wide range of configurable parameters to identify defects & trip the breaker in a controlled & selected manner. PSM – Plug Setting Multiplier (Current Setting Multiplier) What is PSM?
