

Enclosed Cold Aisle Side Panels of the Server Rack

Overview

A typical Cold Aisle Containment system features enclosed cold aisles with doors at each end, a ceiling-mounted cooling system, and blanking panels to seal off unused server rack spaces. Essentially creating a room within the aisle, the system helps keep hot and cold air separated to make existing air conditioning systems in data center and edge-of-network. Cold aisle containment systems use doors at aisle ends, ceiling panels or lids above racks, and structural frames to create enclosed zones where cold supply air flows directly to IT equipment intakes. Without containment, cold supply and hot exhaust air mix throughout the data center. Cooling units. n is a best practice solution that separates hot and cold air streams. This method raises the temperature of the air returning to a Computer Room Air Con itioner (CRAC) unit, which allows the unit to operate more efficiently. However, without a physical barrier, you can still have wrap-around and. Enhance cooling efficiency and reduce energy costs with aisle containment solutions from Server Racks Online.
