

# Fiber Optic Cable Multimode Identification

## Overview

Identified by ISO 11801 standard, multimode fiber optic cables can be classified into OM1 fiber, OM2 fiber, OM3 fiber, OM4 fiber and newly released OM5 fiber. The next part will compare these fibers from the side of core size, bandwidth, data rate, distance, color and optical. Choosing the right type of fiber optic cable is essential for reliable and cost-effective network performance. The two main types — Single Mode (SM) and Multimode (MM) — differ in construction, performance, and application. Multimode Fiber (MMF) has a core diameter, typically 50-100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at. Fiber optic cables use light to transmit data, while traditional cables, such as copper cables, use electrical signals. In fiber optic cables, data is transmitted as pulses of light that travel along a thin strand of glass or plastic fiber. The industry standard color for OM2 is grey. However, there are some early OM2 cable installed that is orange, so always check the markings to make sure.
