

How to calculate the weight of plastic cable trays

Overview

This tool estimates tray self-weight from material density and an approximate metal volume. For solid and perforated trays, it treats the tray as a formed sheet:
Developed sheet width per meter: $Dev = W + 2H + 2R$
Metal volume per meter: $V = Dev \times t \times 1 \times (1 - Open\%)$. Estimate cable tray self weight quickly for planning and procurement accurately. Export results instantly for schedules, submittals, and field checks. Density values are typical engineering references. In this guide, we'll walk you through the step-by-step process for calculating cable tray weight, while providing examples for both channel trays and ladder trays. Selecting the appropriate cable tray dimensions and size is essential for many kinds of reasons: The size of the cable tray has to be suitable on account. The cable load can be calculated using:
Where: Example Calculation: If each cable weighs 2 kg/m, there are 20 cables, and the span is 2 meters: Cable tray manufacturers provide weight specifications based on tray type and material.
