

Laboratory power distribution box circuit

Overview

Most parts are easily accessible, including a 6"x3"x2" project box, 12V 1. 2A center tap transformer, pots, knobs, etc. Power supply schematic shows how to wire LM317/LM337 to get +/- split voltage output. The circuit is assembled on 2 perfboards. From my point of view one of the best ways to get started in electronics is to build your own laboratory power supply. In this instructable I have tried to collect all the necessary steps so that anyone can construct his or her own. The voltage and current ranges are independently variable from 0 to 50 V, and 0 to 5 amps respectively. Having said that, because of the DIY layout, you can customize the settings as. The DC Power Distribution System (DC PDS) allows the distribution of a bipolar DC voltage to ten individual output channels which are electronically fused (eFuse). Here are the lab's essentials: 1. Must provide a regulated output 2.
