

PON Single-mode or multi-mode fiber

Overview

Singlemode fiber delivers superior range and scalability for backbone and long-distance transmission, while multimode fiber provides an economical, high-performance solution for short-range connectivity. There are two main types of fiber optic cables: single mode and multimode. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets. That makes picking between single mode and multimode fiber optic cables an. Read on for a breakdown of the difference between single mode and multimode fiber, how they work, and which environments benefit most from each. Because the light doesn't bounce around inside the core. But not all fiber cables are created equal: multimode (MM) and single mode (SM) fibers are the two primary types, each engineered for specific use cases, from short-range data center connections to transcontinental telecom backbones.
