

PoE Monitoring Splitting Switch

Overview

By leveraging a managed PoE switch or an inline splitter, you can efficiently distribute power and data to both cameras without compromising performance or running separate cables. This setup reduces clutter, saves on infrastructure costs, and is ideal for scalable surveillance. Power over Ethernet (PoE) is a technology that transmits both data and electrical power over a single Ethernet cable. This eliminates the need for separate power supplies for devices such as IP cameras, VoIP phones, or wireless access points. You can enable PoE information polling on SNMP-polled. Splitting one PoE connection to power two cameras is simple and cost-effective using a PoE splitter or a PoE switch with multiple ports. - YouTube Thank you for inquiring. It is powered by 48V or 53V PoE. This guide explores the core components that make PoE possible, including injectors, switches and splitters.
