

Select how many ports on the aggregation switch

Overview

A dynamic aggregation group can contain up to 12 ports. Out of the 12 ports, eight ports will be in the band I state and the remaining four will be in the backup state. Because of this, you should not aggregate two ports connected from a UniFi Switch to an unsupported UniFi Gateway. What are the use cases for aggregation?

Switch-to-Switch Aggregation: This is useful in scenarios where you need to interconnect multiple switches to increase the bandwidth available. Port aggregation allows you to group multiple physical ports into one unit. This process, also known as link aggregation or LAG (Link Aggregation Group), is essential for optimizing network performance. These aggregation switches typically operate at Layer 2 or Layer 3 of the OSI model, depending on the network topology and configuration requirements. A round-robin algorithm is used for load balancing traffic across the interfaces in an aggregated link. This is exactly what the FS-2048F provides:.
