

# The lc port fiber optic patch cord has dust

## Overview

Specifically designed swabs with smooth tips glide safely across angled fiber endfaces. The soft pad lifts away oils, dust and other contaminants without scratching. Always reach for pure IPA instead for safe . Summary: Dust or chemical contamination at the endface of a fiber optic LC connector or transceiver module impedes signaling. Dell engineering teams have verified cases in which a fully functional port appears to be a bad port because dirty optical connectors manifest as a port failing loop testing. A staggering 98% of all fiber optic network failures can be traced back to one insidious culprit: contamination on connector end-faces. Even tiny contaminants—such as dust, oils, moisture, or other residues—can cause significant signal loss, increased reflectance, and permanent damage when connectors are mated. Ultimately, your network connections fail. Proper cleaning. The LC connectors are mainly used for high-density interconnections and have a unique click-in connection feature.
