

What is a WAP distribution box

Overview

WAPs extend the wireless coverage of an existing network and router. They connect to the network via Ethernet cables. They are powered by Power over Ethernet (PoE), which is often provided by Ethernet network switches. These WAPs emit a wireless signal, usually WiFi or Bluetooth. You might also recognise WAPs as WiFi Hotspots that you find in restaurants. You might have heard about Wireless Repeaters (or range extenders). These are commonly used in home environments. Usually bought to maintain the peace between kids who want to stream Netflix upstairs and parents who would like some peace and quiet. It is fair to say that extenders are like WAPs. They have similarities but some very distinct differences. So, if WAPs are like carrying around a mini router in our pocket - why do we have routers?

Here are the main differences: 1. The router is a hub that sets up your Local Area Network and manages all devices connected to it 2. WAPs are a sub-device within the LAN which provides another location for devices to connect to WiFi Routers are basically the same. Wireless Access Points are great for: 1. Large offices where employees/customers need to roam and stay connected 2. Schools 3. Coffee shops 4. Train stations 5. Airports 6. Libraries Some areas have introduced city-wide WiFi using WAP technology. Newcastle, London, Manchester and Edinburgh all have free WiFi throughout the City. While the connectivity is improving.
