

Why is communication related to optical modules

Overview

An optical module is a small device for communication. It can send and receive data at the same time. As an essential component of optical fiber communication, optical modules are optoelectronic devices that facilitate the conversion between optical and electrical signals during the transmission process. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. That is, metal medium communication represented by coaxial cables and network cables is gradually being replaced by optical fiber media. An. Light transmission by various optical fibers Semiconductor lasers convert electrical “0” and “1” signals into blinking optical signals (intensity modulation) and are suitable for high-speed data communications because of their ability to be modulated at high speeds, and photodiodes convert the.
